Displaying Data from Multiple Tables

Objectives

At the end of this lesson, you should be able to:

- **Write SELECT statements to access data from more than one table using equality and nonequality joins**
- **View data that generally does not meet a join condition by using outer joins**
- **Join a table to itself**

Obtaining Data from Multiple Tables

What Is a Join?

Use a join to query data from more than one table.

```
SELECT    table.column, table.column  
FROM      table1, table2  
WHERE     table1.column1 = table2.column2;
```

- Write the join condition in the WHERE clause.
- Prefix the column name with the table name when the same column name appears in more than one table.

Cartesian Product

- **A Cartesian product is formed when:**
 - **A join condition is omitted**
 - **A join condition is invalid**
 - **All rows in the first table are joined to all rows in the second table**
- **To avoid a Cartesian product, always include a valid join condition in a WHERE clause.**

Retrieving Records with Equijoins

```

Qualifying Ambiguous Column Names

- **Use table prefixes to qualify column names that are in multiple tables.**
- **Improve performance by using table prefixes.**
- **Distinguish columns that have identical names but reside in different tables by using column aliases.**

Additional Search Conditions Using the AND Operator

Using Table Aliases

Simplify queries by using table aliases.

```
SQL> SELECT emp.empno, emp.ename, emp.deptno,  
2          dept.deptno, dept.loc  
3 FROM    emp, dept  
4 WHERE   emp.deptno=dept.deptno;
```

```
SQL> SELECT e.empno, e.ename, e.deptno,  
2          d.deptno, d.loc  
3 FROM    emp e, dept d  
4 WHERE   e.deptno=d.deptno;
```

Retrieving Records with Non-Equi Joins

```
SQL>  SELECT    e.ename, e.sal, s.grade
      2  FROM      emp e, salgrade s
      3  WHERE     e.sal
      4  BETWEEN   s.losal AND s.hisal;

OPERATIONS department**

Outer Joins

- You use an outer join to see rows that do not usually meet the join condition.
- Outer join operator is the plus sign (+).

```
SELECT table.column, table.column  
FROM   table1, table2  
WHERE  table1.column (+) = table2.column;
```

```
SELECT table.column, table.column  
FROM   table1, table2  
WHERE  table1.column = table2.column (+);
```

Using Outer Joins

```
SQL> SELECT    e.ename, d.deptno, d.dname
  2  FROM      emp e, dept d
  3  WHERE     e.deptno(+) = d.deptno
  4  ORDER BY  e.deptno;
```
